```
This sequence represents a primatized form of the antibody 7B6 heavy chain from macaque. This sequence is used in a method which studies new moncolonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving really entitle interactions, particularly autoimmune diseases, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppression.
                        New monoclonal antibodies specific for B7.1 or B7.2 antigens and Inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between T and B
                                                                                                         cells, e.g. graft rejection or tumours
                                                                                                                                                                  4b; 87pp; English

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD80) for inducing the apoptosis of B7.2 antigen (CD80) for inducing the apoptosis of B7.2 antigen (CD80) for inducing the apoptosis of B7.2 antigen or accer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as indopathic thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in human or animal and for treating or preventing resistance to or rejection of transplanted organ or fissue for treating proliferative antways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative collitis, food-related allergies e.g. migraine, chintis and eczema, and other types of allergies. The present protein sequence represents the heavy chain of 786, a primatised antibody ö GKGPEWVGFIRNKPNGGTTEYAASVKDRFTISRDDSKSIAYLQMSSLKIEDTAVYYCTTS 120 GKGPEWVGFIRNKPNGGTTEYAASVKDRFTISRDDSKSIAYLQMSSLKIEDTAVYYCTTS 120 YISHCRGGVCYGGYFEFWGQGALVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDY 180 9 Human; macaque monkey; light chain; primatised antibody; 7B6 antibody; neuroprotective; apoptosis inducer; allergy; CD28 receptor antagonist; B7_1 antigen; CD86; B cell cancer; metastasis; tumour; B cell lymphoma; B cell leukaemia; autoimmune disease; graft-vs-host disease; immunosuppression; organ rejection; Protein sequence of primatised form of the heavy chain of 7B6 antibody 1 MGWSLILLFLVAVATRVQCEVQLVESGGGLVQPGGSLRVSCAVSGFTFSDHYMYWFRQAP Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as Gaps Length 478; 100.0%; Score 2561; DB 23; 100.0%; Pred. Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CDB6) and/or B7.2 antigen (CDB6) for inducing the appross of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leuksemia, and autoimmune diseases such as idiopathic thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoia arthritis, psoriasis, aplastic anaemia, inflammatory bile diseases, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression

                                                                                                                                                                                                                                                               This sequence encodes a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new monclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antiqens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell's eall interactions, particularly autoimmune disease, specifically idopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, infections with the service of inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumnours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-ddictype reagents and as vaccines or immunogens to develop anti-ddictype reagents. MAD's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and inhibits antigen-specific immunoglobulin G (19G) responses.

Patent No. 6492134
GENERAL INFORMATION:
APPLICANT: Anderson, Darrell R.
TITLE OF INVENTION: "MONKEY MONCLONAL ANTIBODIES SPECIFIC
TITLE OF INVENTION: TO HUMAN B7.1 AND/OR B7.2 PRIMATIZED FORMS THEREOF,
TITLE OF INVENTION: PHARMACEUTIAL COMPOSITIONS CONTAINING, AND USE THEREOF PITTLE OF INVENTION: IMMUNOSUPPRESANTS"
NUMBER OF SECUENCES: 12
CORRESPONDENCE ADDRESS:

```
This sequence represents a primatized form of the antibody 16C10 light chair sequence represents a primatized form of the antibody 16C10 light chair from macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such mab's are specific immunosuppressants for treatment of diseases involving a clopathic thrombocytopaenia parputa, systemic lupus erythematosus, type idiopathic thrombocytopaenia parputa, systemic lupus erythematosus, type idiopathic thrombocytopaenia parputa, systemic lupus erythematosus, type idiopathic thrombocytopaenia parputa, systemic lupus erythematosus, concern fost diseases, a leafy and multiple solerosis, graft vs. Inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the NAb can be conjugated to a drug or toxin. MAb's, or their fragments, can also be used as imaging agents and as vaccines or immunosques to develop anti-idiotype reagents. MAb's are optionally combined with other proteins or small molecule immunosuperessants. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuperession, i.e. it inhibits antigen-specific immunosuperses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PGTAPKLLIYDINKRPSGISDRFSGSKSGTAASLAITGLQTEDEADYYCQSYDSSLNAQV 120

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CDB0) and/or B7.2 antigen (CDB0) for inducting the apoptosis of B7+ cells. The invention is useful for treating the apoptosis of B7+ cells. The invention is cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as Grinopathic thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple solercisis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating reversible obstructive and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative colitis, food related allergies e.g. migraine, chinitis and eczema, and other types of allergies. The present protein sequence represents the light chain of 16ClO, a primatised antibody used in the invention to induce apoptosis and inhibit production of

interleukin-2 (IL-2).

Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10, A

                                                                                                                                     2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAW01821 and AAW01822) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody into an expression vector (pref. NEOSPLA) which contains human light and heavy to an constant region genes to allow prodm. of primatised antibody in e.g. CHO cells. Primatised 7010 and 736 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.
